Senior Risk Manager | Credit Risk & Model Governance @ Kotak
Mahindra Bank | IISc M.Mgt— Distinction | GATE AIR 6
Bengaluru, Karnataka, India

Summary

I build risk systems that work at scale — from scorecards that rank millions of customers to exposure frameworks that make every credit limit defensible. Currently at Kotak Mahindra Bank as a Risk Manager on the Model Governance team, I sit at the intersection of credit risk, data science, and regulatory compliance. My work spans model development, validation, and the governance frameworks that sit behind large-scale lending decisions. Key work so far: Built the MFI Challenger Model delivering #550 Cr+ in incremental business with a 10% GINI lift over the benchmark Engineered the Customer-Level Exposure Management Framework — a full-stack scoring and limit-stamping system covering the entire Kotak franchise base Designed safe-limit expansion logic to systematically correct under and over-leveraged accounts across the consumer bank Academic foundation: Masters in Business Analytics from IISc (8.5 GPA, Distinction) | GATE AIR 6 | B.Tech in Agricultural Engineering, UAS Bangalore (8.47 GPA) I'm particularly interested in the overlap between statistical rigour and real-world credit risk — where model elegance meets regulatory defensibility. Open to conversations around credit risk, model governance, and risk analytics.

Experience

Kotak Mahindra Bank

2 years

Senior Risk Manager - Model Governance & Credit Risk
May 2026 - Present (2 months)
Bengaluru

Customer-Level Exposure Management Framework

Built an end-to-end scoring and exposure management system for the entire Kotak franchise base — from raw bureau data to automated monthly limit stamping on every customer.

Engineered 15,000+ features from consumer bureau and banking behavioral data

Built the KMBL Score (B-score) using a 12MOB 90+ DPD target, creating a statistically grounded risk ranking across the franchise

Applied Decision Tree-based segmentation to create risk-homogeneous cohorts with bad-rate-based tiering ensuring monotonicity

Layered affluence segments (income proxies) onto risk tiers to form a 2-dimensional risk-affluence grid

Computed cohort-level exposure-to-income ratios to derive income multipliers separately for Secured, Unsecured Term, Unsecured Revolving, and Total exposure

Designed 3-gate decisioning logic: Gate 1 (total exposure), Gate 2 (unsecured-all), Gate 3 (product-specific limit)

Designed safe-limit expansion logic to systematically identify and correct under-leveraged and over-leveraged accounts across the consumer bank

Automated the full pipeline on Apache Airflow DAG hosted on Azure — monthly scoring, limit computation, monitoring, and auditability built in

Impact: Replaced ad-hoc exposure rules with one unified, scalable framework where the same score drives product-specific limits across the entire franchise.

MFI Challenger Model

Built a Microfinance acquisition scorecard that outperformed the existing benchmark model.

Developed the full challenger scorecard using bureau and alternative data

Achieved 10% GINI lift over the incumbent champion model

Deployed with full scoring and monitoring pipeline

Impact: #550 Cr+ incremental business enabled through risk-differentiated acquisition

Risk Manager — Model Governance & Credit Risk

Research Project

January 2024 - June 2024 (6 months)

Bengaluru, Karnataka, India

A Robust Tabular Data Question Answering Engine for Electricity

a. Developed an advanced question-answering (QA) engine tailored for the electrical sector, utilizing TAPAS and Retrieval-Augmented Generation (RAG) techniques to handle complex tabular data queries.

- b. Worked extensively with tabular data, extracting and structuring information in JSON format from Central Electricity Authority (CEA) Apis of Peak energy and Energy requirements of states of India.
- c. Addressed limitations of TAPAS's Sot model for tabular data by implementing RAG, which significantly improved context handling and retrieval accuracy.
- d. Innovated a novel data chunking method, effectively overcoming TAPAS's 512 token limit, thereby expanding the model's context capacity and enabling more comprehensive queries. Also enhancing its ability to handle larger datasets and improving overall system efficiency.
- e. Implemented LLM model architecture Wizard LLM2 to enhance the interpretation of natural language queries and to manage sophisticated, context-dependent questions more effectively.
- f. Integrated Qdrant vector database for efficient embedding storage and retrieval, and utilized Cohere's rerank model for prioritizing the most relevant content by leveraging the Cosine Similarity.
- g. Created an interactive dashboard using Stream lit to visualize query results and data insights, making it easier for users to interact with and understand the data.

Bosch

Data Scientist

June 2023 - July 2023 (2 months)

Bengaluru, Karnataka, India

:-

1. Developed an Electric Vehicle range prediction model incorporating internal and external factors using LSTM and ensemble models (Random Forest).
2. Created a model for Compatibility Time Prediction utilizing XGBoost.
3. Implemented Driver Behavior Recognition through clustering techniques.

Education

Indian Institute of Science (IISc)

Masters of Management, Business Analytics · (August 2022 - July 2024)

University of Agricultural Sciences, Bangalore

Bachelor of Technology , Agriculture Engineering · (August 2018 - June 2022)
